

Tier. PCS Market Portal

Principle. "Use the Airport Service Bus (ASB) for sharing / exchanging of operational data between applications and parties where routing, filtering, data transformation (integration rules) or transport transformation capabilities are needed."

Rationale.

The ASB is an integration platform, because it adds functionalities to integrate two or more known systems.

ASB adds functionality like routing, transformation, aggregation, throttling, basic reliable messaging and user management.

Beyond, the ASB causes more integration work. This need is due to the increased data exchange when the # of connected applications increases.
